

BLM LEASE-SALE TRACKER

An automated tracker that watches the BLM National Fluids Lease Sale System and notifies you a few days before a sale is held or completed.

WHY THIS FORM

The NFLSS site (nflss.blm.gov/s/sales) has no public API — the sales list is drawn from a Salesforce back-end and rendered in the browser. That's buildable, but the right approach depends on the answers below.

Answer what you can. Anything marked **[technical]** we can do together on a quick screen-share. Parts D & E are what unblock the proof-of-concept.

A WHAT TO TRACK — SCOPE

- 1 **Which sales matter to you?** All BLM lease sales nationwide, or specific **states / BLM state offices** (e.g., New Mexico, Wyoming, Colorado)? If specific, please list them.
- 2 **Oil & gas only, or also geothermal?** NFLSS covers both.
- 3 **Any minimum size or type of sale?** (e.g., acreage, number of parcels) — or every sale regardless of size?
- 4 **Upcoming, completed, or both?** Are you tracking **scheduled** sales, **results** of completed sales, or both?

B WHEN TO ALERT — TRIGGERS & TIMING

- 5 **How many days ahead?** You mentioned “a few days prior” — e.g., 7 days? 3 days? Both a 7-day and a 1-day reminder?
- 6 **Which events should trigger a notification?**
 - ☐ A new sale is **scheduled / announced**
 - ☐ A sale is about to be **held** (X days before the sale date)
 - ☐ A sale has been **completed** (results posted)
 - ☐ A sale date **changes** (rescheduled / canceled)
- 7 **How often should it check?** Is once **daily** fine, or do you need it more frequent near a sale date?

C HOW TO ALERT — DELIVERY

- 8 **Where should alerts go?**
 - ☐ Email to **you only** (sandra.petkov@bicrea.com)
 - ☐ Email to a **team / distribution list** (list addresses)
 - ☐ Text / SMS
 - ☐ A **subscribable calendar feed** (an .ics you add to your calendar) — instead of or alongside email
- 9 **What should each alert contain?** e.g., sale name, state, sale date, days remaining, parcel count, a direct link. Anything else you'd want at a glance?
- 10 **Preferred format?** A plain summary email, or a formatted digest listing all upcoming sales in one message?

D ACCESS & LOGIN

TECHNICAL · MOST IMPORTANT — THIS DETERMINES THE WHOLE APPROACH

- 11 **Is login required to see the sales list?** When you open `nflss.blm.gov/s/sales`, do you have to be logged in, or is the list visible to anyone? If **login is required**, we'll set up a secure way to share a dedicated account — please don't email a password in plain text. If it's **public**, this gets much simpler.
- 12 **Same info logged out vs. logged in?** If you can, glance at the list both ways and note any difference.

E SCREEN CAPTURES WE NEED

TECHNICAL · ALL FROM GOOGLE CHROME ON DESKTOP

If any feel fiddly, save them for the screen-share. But Captures 1 & 2 alone unblock most of the work, and Capture 3 confirms the cleanest data path.

1 The sales list page — screenshot

Open `nflss.blm.gov/s/sales` (log in first if required) and take a full screenshot once it loads.

Why: shows the columns/fields that exist — sale name, date, status, state, etc.

2 One sale's detail — screenshot

Click into a single sale to open its detail view, then screenshot it.

Why: shows the full data per sale — especially whether a **scheduled sale date** is shown (that's what the “notify X days before” logic keys off).

3 The data request — the linchpin

THIS ONE TELLS US WHETHER WE CAN PULL THE DATA CLEANLY

- 1 On the `.../s/sales` page (logged in if needed), open Chrome dev tools: `View > Developer > Developer Tools` (or `⌘⌘I` on Mac).
- 2 Click the **Network** tab.
- 3 In the filter box, type `aura`.
- 4 Reload the page (`⌘R`). Rows appear as the list loads.
- 5 Find a row named `aura` (usually type `xhr`, method `POST`) that appears when the list loads, and click it.
- 6 Right-click it → **Copy** → “Copy as cURL”.
- 7 Paste the result into a plain text file and send it over.

▲ TREAT CAPTURE 3 LIKE A PASSWORD

If you were logged in, that copied text includes your live session, so please send it through a secure channel (not plain email — Jasper will set one up). It also **expires quickly**, so a same-day capture, right when we're ready to build, is ideal.

F A FEW DECISIONS FOR US — NO ACTION NEEDED

NOTED SO THE PICTURE'S COMPLETE

- ☐ Hosting: scheduled **Cloudflare Worker + Cron Trigger** (fits our existing stack).
- ☐ Storage of “already-seen / already-notified” sales: Workers KV or D1.
- ☐ Outbound email provider for alerts (Email Routing is inbound-only; we'll add a send service).
- ☐ Politeness/compliance: BLM data is public; we'll poll gently (once daily) and respect the site.

WHAT HAPPENS NEXT

Once we have **Part D (the login answer)** and **Capture 3 (the aura request)**, we can confirm the approach and stand up a **proof-of-concept**: a scheduled job that pulls the sales, finds the ones within your chosen window, and sends you a test alert. From there we tune the timing, content, and delivery to match your answers above.
